

Nykaa Campaign Analysis

A practical marketing analytics case study focused on one simple question: **where is campaign money working, and where is it being wasted?**

THE BUSINESS CONTEXT

The dataset contains 55,555 campaign records covering Jul 2024 to Jun 2025. Instead of looking at individual campaigns in isolation, I used the data to understand the bigger picture — revenue, ROI, acquisition cost, funnel performance, audience, language and campaign duration — and then turned those findings into an easy-to-read dashboard.

■2,866 Cr Total revenue	2.71x Average ROI	57M Total conversions	23.8% Negative-ROI campaigns
---	---	---	--

What I did • Cleaned and validated the campaign data in Python/Pandas. • Built SQL queries to answer business questions using aggregations, CTEs, joins and window functions. • Used Power BI to bring the findings together into an executive-style dashboard. • Focused the analysis on decisions a marketing team could actually act on.	Questions the analysis answers • Which campaign types bring in the most revenue? • Where does the conversion funnel lose users? • How large is the negative-ROI problem? • Which audience, language and duration combinations look strongest? • Which campaigns deserve immediate review?
--	--

My approach

01 Data validation	02 SQL analysis	03 Segmentation & trends	04 Power BI dashboard	05 Business recommendations
--	---------------------------------------	--	---	---

The story the data tells

Revenue is strong, but performance is not evenly distributed. Influencer campaigns lead campaign types on revenue at about ■5.77bn, while the average ROI across the portfolio is 2.71x. At the same time, 23.8% of campaigns are negative-ROI, so the headline opportunity is not simply to generate more sales — it is to make the existing budget more efficient.

The funnel points to the clearest immediate problem. There are about 3.06B impressions, 260M clicks, 104M leads and 57M conversions. Only 8.51% of impressions become clicks, so the biggest leakage happens before users even enter the lead stage.

There are also clear signals for targeting. Premium Shoppers contribute the largest audience revenue at about ■585 Cr, Hindi has the highest average ROI at 2.76x, and medium-duration campaigns (11–20 days) have the strongest average ROI at 2.76x.

In one sentence: The campaign portfolio is generating healthy revenue, but the next improvement should come from better targeting and funnel efficiency rather than simply increasing campaign volume.

Dashboard & key recommendations

The dashboard is designed to be read from top to bottom: portfolio health → funnel → segments → ROI risk → action.

What this project demonstrates

I did not stop at building charts. The workflow connects raw campaign data to SQL-based analysis, clear performance patterns and business actions. The dashboard is intentionally simple so a stakeholder can understand the main story in a few seconds and then drill into the details.
